ThinkDash 1.0 – Android test report

Hands-on test on an Android emulator · 28 October 2026

App	ThinkDash (`com.thinkdash.app`), version 1.0 (versionCode 1), unreviewed test build installed from Google Play
Requirements	minSdk 32, targetSdk 36; permissions requested: INTERNET and ACCESS_NETWORK_STATE only
Environment	Android Emulator, Pixel 7 profile, Android 16 (API 36) Google Play image, x86_64, 1080×2400
Method	Driven through adb and uiautomator (taps, text dumps, screenshots) and read from logcat. Screenshots below were captured on the emulator. Font size, screen size and dark mode were changed temporarily for the device checks and then restored.

Summary

0
crashes or ANRs in any test

1
high-severity issue (AI generation)

10
medium issues

13
low issues (layout, copy, navigation)

The app is stable and its core study loop works: the sample quiz scored correctly (60%, matching the answers given), flashcard progress and the dark theme survived a cold restart, and rotation, going offline, an incoming call and a Home-key resume did not lose state. A second round covered the Library, every button on the quiz results screen, quiz and flashcard navigation, the Home shortcuts, and device checks (font size, screen size, system dark mode, accessibility labels). The main problem is that **AI generation could not be tested**: every attempt on the emulator was rejected by Firebase App Check. Whether real phones are affected is not known and should be checked on a physical device.

Issues found

#	Severity	Issue	Evidence
1	High	**AI generation fails every time on the emulator** Firebase App Check rejects the request (403 "App attestation failed", Play Integrity provider), so no quiz or flashcards are produced. Unknown whether real phones are affected; this decides the severity.	Fig. 22, Fig. 23
2	Medium	**Focused flashcard queue shows a wrong mastery message** "100% Deck Mastery! All 1 cards scheduled for long-term retention" while the real deck mastery is 40%. The stats cover only the filtered cards. "All 1 cards" is also a grammar slip.	Fig. 14
3	Medium	**No way out of the focused queue** The banner is not tappable and Restart Deck only flips the card back. The only exit is leaving the deck.	Fig. 13, Fig. 15
4	Medium	**Offline error is too vague** "Something unexpected happened" never says the device is offline or to check the connection.	Fig. 21
5	Medium	**Online error shows internal wording** Exposes "Firebase App Check token is invalid" to users and tells them to check their internet when the connection is fine.	Fig. 23

6	Medium	**Quiz badge counts answered questions, not correct ones** The "3/5" badge looks like a score but only counts answers given. Grading appears only on the results screen.	Fig. 8
7	Medium	**Cards can be rated without revealing the answer** Know it and Review again work on a card that was never flipped, so a card can be marked by accident.	Fig. 11
8	Medium	**Ambiguous "Review" counter** A fresh deck shows "5 Review" next to "0 Due Now".	Fig. 11
9	Low	**Status bar icons unreadable in dark mode** Clock, Wi-Fi and battery are dark on a dark background on every screen.	Fig. 16, Fig. 17
10	Low	**Landscape quiz is cramped** Fixed header and footer take about 70% of the height; one option visible at a time; blank strip on the left edge.	Fig. 19, Fig. 20
11	Low	**Home greeting is truncated** Even the 6-letter name "Tester" shows as "Good evening, T...", so the personalised greeting is unreadable.	Fig. 17
12	Low	**"Study Flashcards" button clipped** The second line of text is cut off on the quiz results screen.	Fig. 9
13	Low	**Progress screen is cramped** "Quiz Accuracy" label crowds the ring; "Deck Mastery 0/0 cards" wraps to three lines.	Fig. 5
14	Low	**Quiz header title truncated** "Macroeconomics & Mone..." in portrait.	Fig. 6
15	Low	**Grammar: "1 attempts"** Plural form is wrong on the Progress tab.	Fig. 10
16	Medium	**An unfinished quiz is lost if Android closes the app** With a quiz half answered, the app was sent to the background and killed (as happens under low memory). Reopening starts at Home and the answers are gone. Saved scores and progress are unaffected. A normal Home-key resume and an incoming call keep the state.	adb test (no screenshot)
17	Medium	**Large-font layout breaks** At the maximum font size the bottom navigation labels break mid-word, the greeting shrinks to "Good ev...", the Library header wraps to five lines and the filter chips clip. Only the maximum size was checked visually.	Fig. 35, Fig. 36
18	Medium	**No warning when finishing with unanswered questions** Finish & Score Quiz accepts 1 of 5 answered, scores 20% and counts the unanswered questions as "Missed", with no confirmation.	Fig. 30
19	Low	**"Resume Quiz" does not resume anything** The Home card opens the quiz at Question 1 with no answers, so the label is misleading.	Fig. 34
20	Low	**System Back from the results screen goes to Home** Opened from the Library (Review Missed) or just after finishing a quiz, Back returns to Home rather than the Library or the quiz. Back from a quiz opened in the Library does return to the Library.	navigation test (no screenshot)
21	Low	**Back arrow silently drops an unfinished retake** Pressing the header Back arrow in the middle of a retake returns to the previous results with no "discard answers?" prompt.	navigation test (no screenshot)
22	Low	**Appearance options expose no selected state** The System / Light / Dark choices all report "not selected" to accessibility services, so a screen-reader user cannot tell which is active.	Fig. 24

23	Low	**Topic suggestion chips are small tap targets** The suggested-topic chips are about 35 dp tall, under the 48 dp guideline. All other tappable items had labels and met the size guideline.	Fig. 2
24	Low	**"Restart Deck" on the last card is misleading** It only returns to card 1 and keeps all progress, so the label suggests a reset that does not happen.	Fig. 33

Severity is the tester's judgment. Clarification: the green tick on a quiz answer means "selected", not "correct". That is by design and is not listed as a bug.

What worked

- Launch, all five tabs, and navigation back and forth, with no crash.
- Sample quiz scoring and the per-question breakdown with correct answers and explanations.
- Quiz and flashcard progress saved locally and shown consistently on Home, Library and Progress.
- Flashcard flip, Know it, Review again, spaced-review labels and the Focus Due Only filter.
- Dark mode and its saved setting after a cold restart; rotation without losing the quiz state.
- Going offline: no crash, and a Dismiss / Try Again prompt.
- Library search (titles and descriptions, case-insensitive), the empty state, Reset Filters, New Set, and the delete confirmation dialog.
- Quiz results buttons: Review Incorrect, Retry Missed (kept the original 60% attempt), Retake Quiz and Study Flashcards. Plus the numbered question pills, Previous / Next, answer retention and Switch to Practice Quiz.
- Home shortcuts (hero buttons, Quick Actions, Library link, Full Analytics) and the System appearance option following the device's dark mode.
- Small-phone and tablet screen sizes, an incoming call during a quiz, and resuming from the background.
- Accessibility labels: every tappable element on the five main screens has a label.

Not tested

- Content quality of AI-generated quizzes and flashcards (blocked by issue 1), file upload, and the Study Notes source, which use the same AI path.
- Confirming a delete (only Cancel was tested, so no data was removed), and the Library filter chips with custom sets (only curated sets exist, so every chip shows the same 2 sets).
- Real screen-reader (TalkBack) use, large font sizes other than the maximum, and landscape on tablet or small screens.
- Any real-device behaviour. Everything here was run on an emulator.

Screenshots follow, grouped by test area. Figure numbers match the Evidence column above.

A. App tour

Cold start and the five bottom tabs. Everything rendered and no crash occurred.

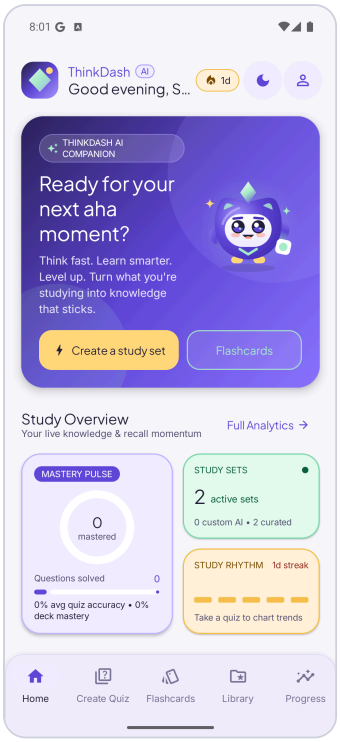

Fig. 1. Home screen after a cold start (about 5 s the first time, 2.6 s later).

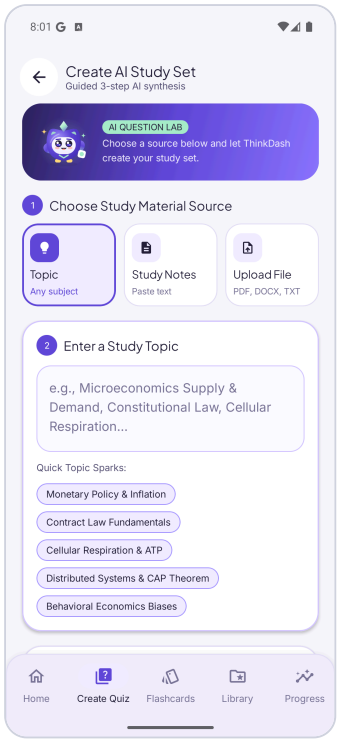

Fig. 2. Create Quiz: 3-step flow (source, topic, depth and length).

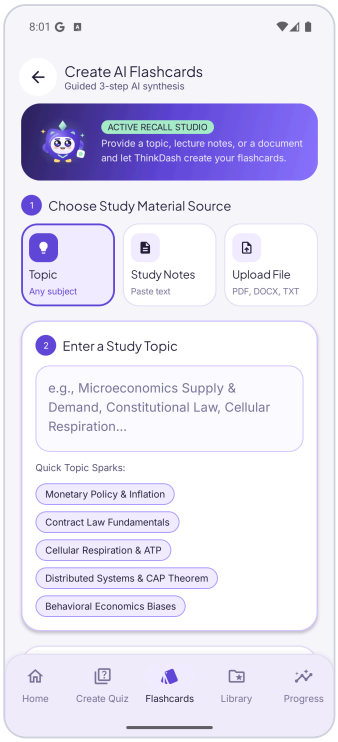

Fig. 3. Create Flashcards: same 3-step flow.

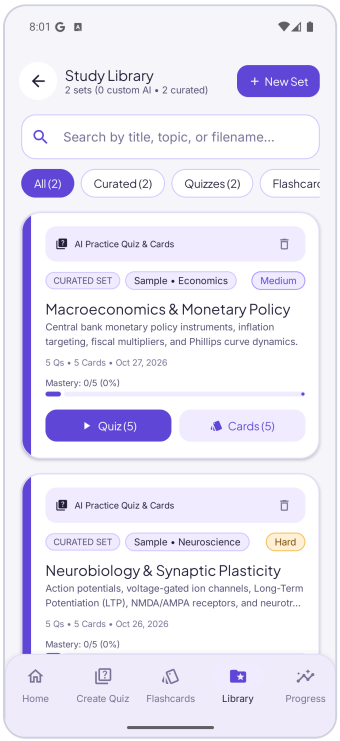

Fig. 4. Study Library with 2 curated sample sets.

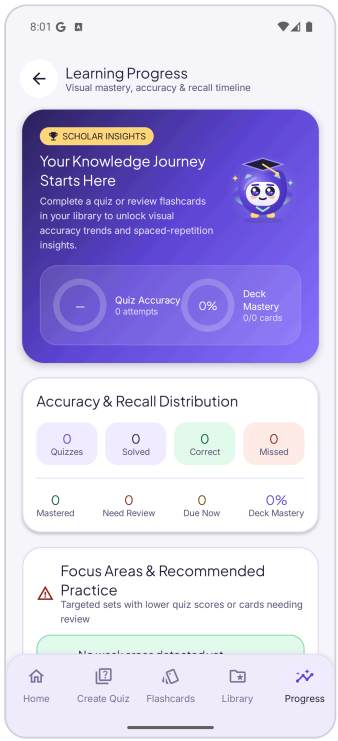

Fig. 5. Progress tab, empty state. Note the cramped "Quiz Accuracy" label.

B. Sample quiz

Answered Q1 and Q2 correctly, and Q3 and Q4 wrongly on purpose, then Q5 correctly. Expected score: 3 of 5.

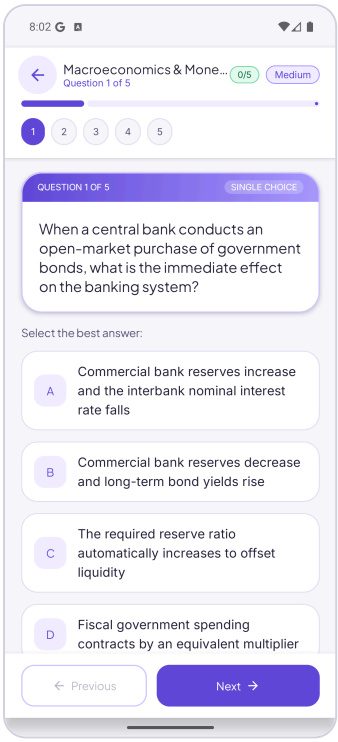

Fig. 6. Question 1 of 5, single choice. The header title is truncated.

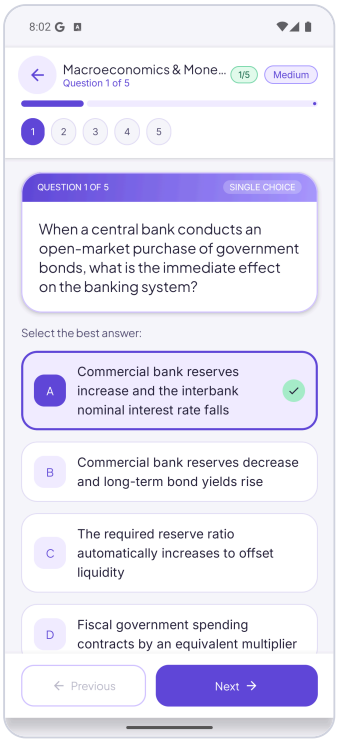

Fig. 7. After tapping an option: the tick is labelled "Selected option" and the badge shows 1/5.

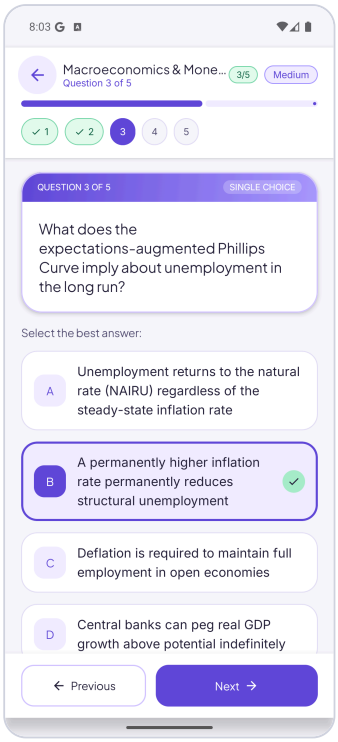

Fig. 8. Q3 answered wrongly on purpose. A tick appears and the badge counts it (3/5), so neither shows correctness.

Fig. 9. Results: 60%, 3 correct, 2 missed, matching the answers given. "Study Flashcards" is clipped.

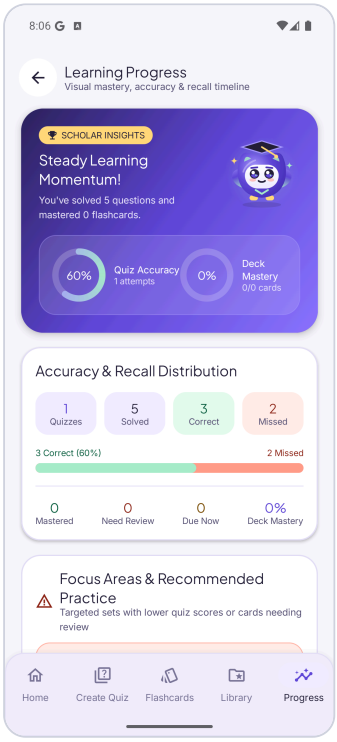

Fig. 10. Progress after the quiz: 60% accuracy, 5 solved. It reads "1 attempts".

C. Flashcards

Flip, Know it, Review again and the Focus Due Only filter. Progress persisted after leaving and reopening the deck (Mastery 2/5, 40%).

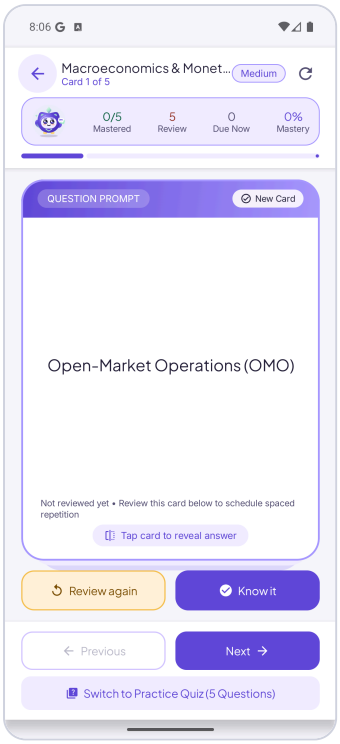

Fig. 11. Card 1 of 5, question side. "5 Review / 0 Due Now" is ambiguous. Rating buttons work even before flipping.

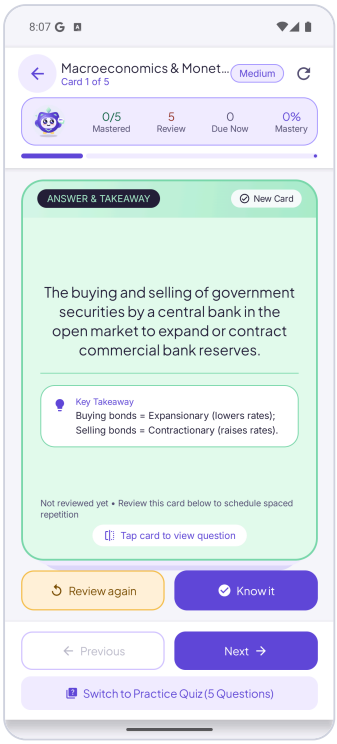

Fig. 12. Card flipped: answer plus a "Key Takeaway".

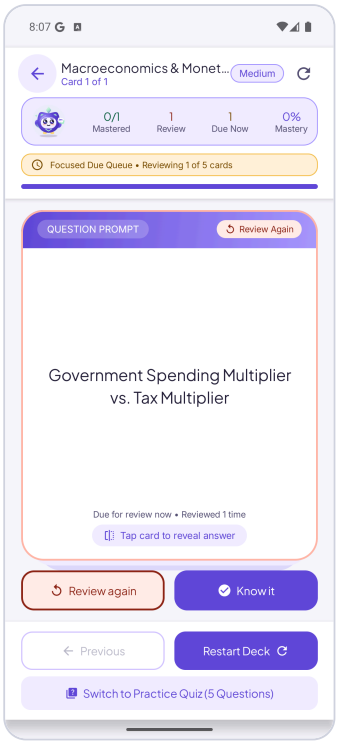

Fig. 13. Focus Due Only: "Card 1 of 1". No control to leave this view.

Fig. 14. Focused queue after Know it: shows "100% Deck Mastery" although the deck is at 40%.

Fig. 15. After Restart Deck: only the card flipped back; still in the focused queue.

D. Dark mode and rotation

In-app dark mode, a personalised greeting, and landscape rotation in the middle of a quiz.

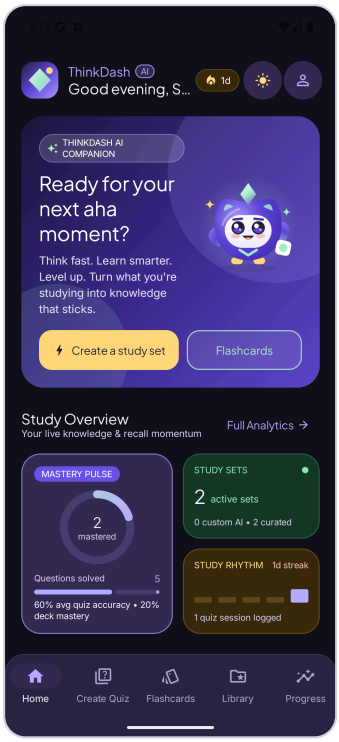

Fig. 16. Dark mode applies everywhere, but the status bar icons (clock, Wi-Fi, battery) are dark on dark.

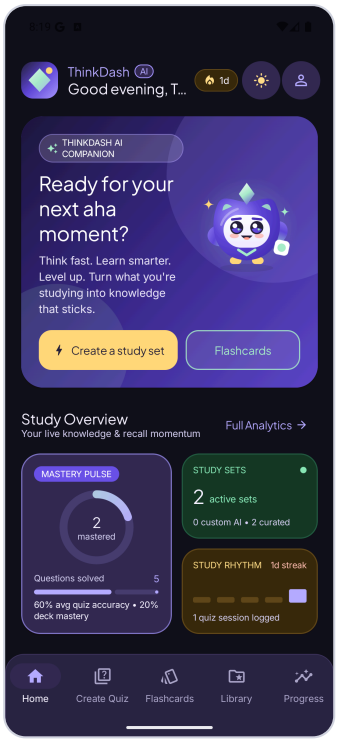

Fig. 17. Name set to the test value "Tester": greeting shows "Good evening, T...".

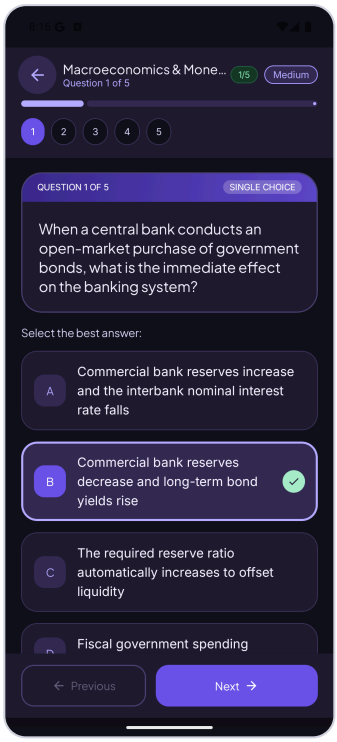

Fig. 18. After rotating and back: question 1, badge 1/5 and the selected option are all kept.

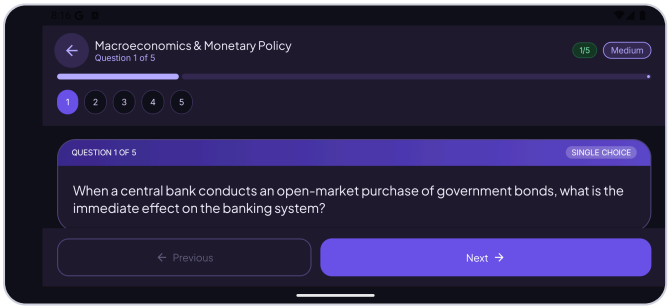

Fig. 19. Landscape quiz: header and footer take about 70% of the height; no answer options visible.

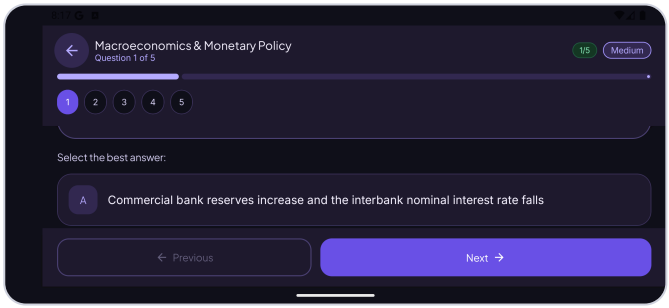

Fig. 20. Landscape after scrolling: only one answer option fits on screen at a time.

E. Offline, AI generation and profile

Generation was tried offline (Wi-Fi off) and online. The online attempts (quiz, retry and flashcards) all failed identically.

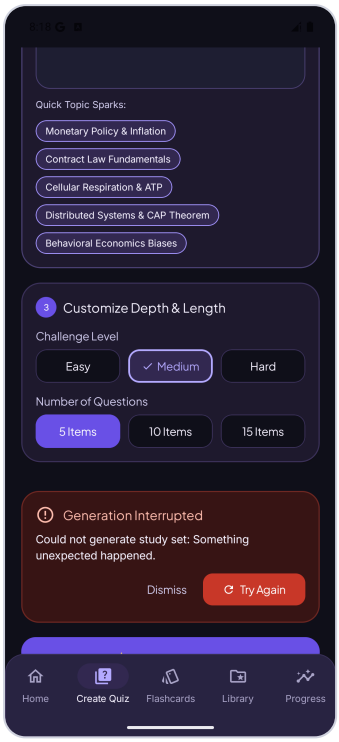

Fig. 21. Offline: "Something unexpected happened". No mention of being offline. Dismiss and Try Again are offered.

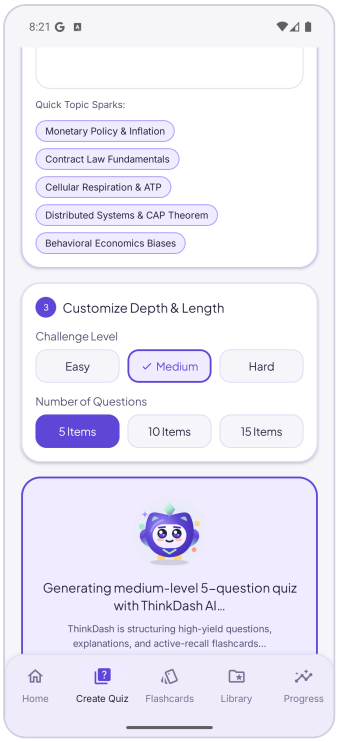

Fig. 22. Online: "Generating medium-level 5-question quiz with ThinkDash AI...".

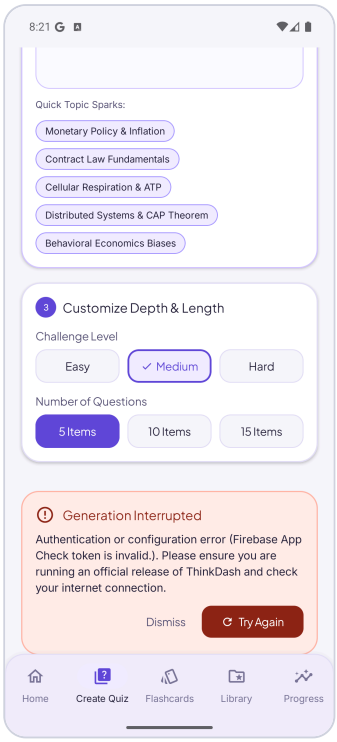

Fig. 23. Online result: Firebase App Check token is invalid (log: 403 App attestation failed).

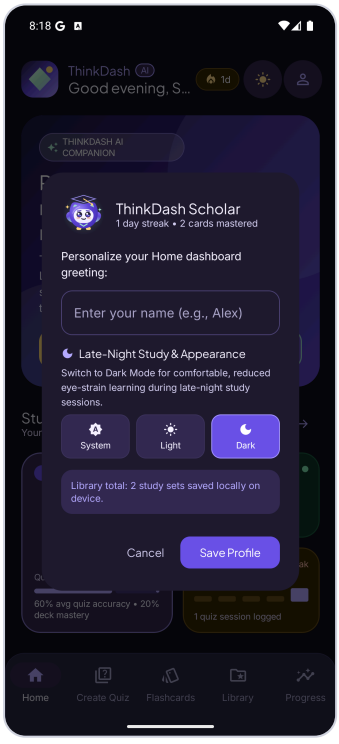

Fig. 24. Profile dialog: name field, System/Light/Dark appearance, "2 study sets saved locally on device".

F. Library, results and navigation (second round)

Library search, the quiz results buttons, quiz navigation and the Home shortcuts. All worked except where noted.

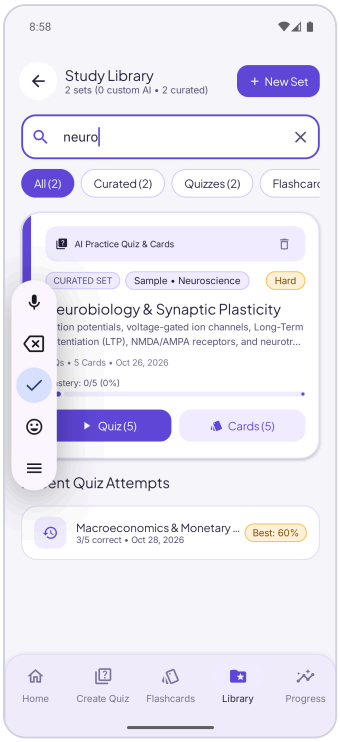

Fig. 25. Search "neuro" filters to the Neurobiology set. It matches titles and descriptions, ignoring case. (The small bar on the left is the emulator keyboard.)

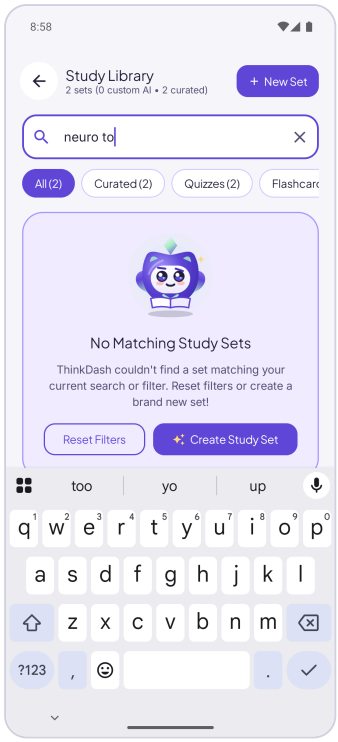

Fig. 26. No match: "No Matching Study Sets" with working Reset Filters and Create Study Set buttons.

Fig. 27. Review Incorrect: the screen becomes "Mistake Review" with only the 2 missed questions; the button changes to Show All (5).

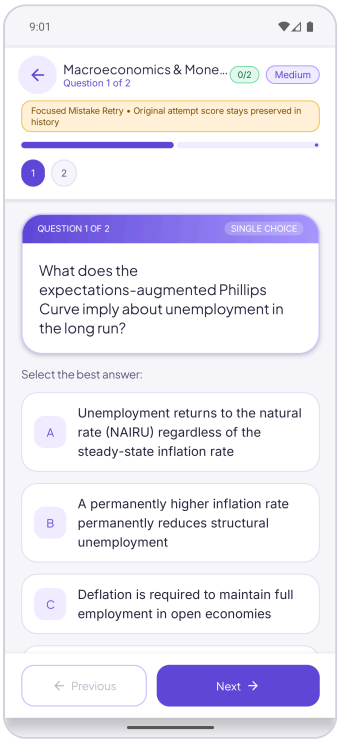

Fig. 28. Retry Missed (2): a focused 2-question drill, "Original attempt score stays preserved in history".

Fig. 29. Drill result 2/2 (100%) with the historical 3/5 (60%) attempt kept.

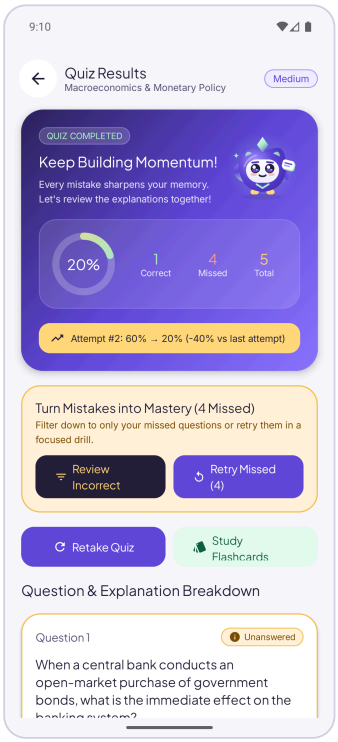

Fig. 30. Finishing with 4 of 5 unanswered: no warning, scored 20%, the 4 counted as Missed. A "-40% vs last attempt" trend line is shown.

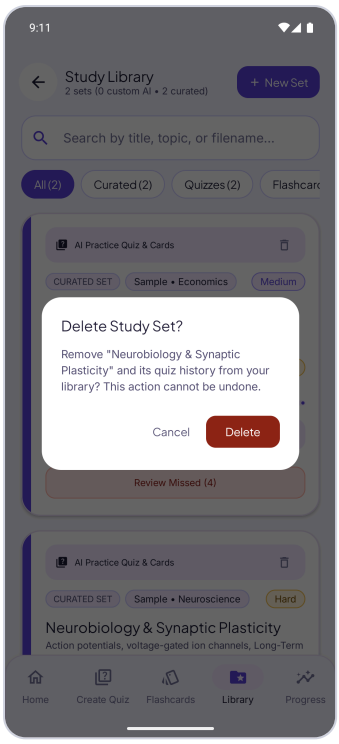

Fig. 31. Delete confirmation: "This action cannot be undone", Cancel / Delete. Only Cancel was tested; nothing was deleted.

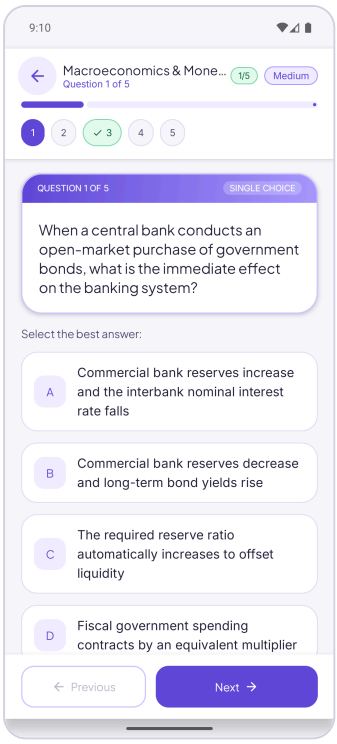

Fig. 32. Numbered pills jump between questions; answers are kept and the badge counts answered questions.

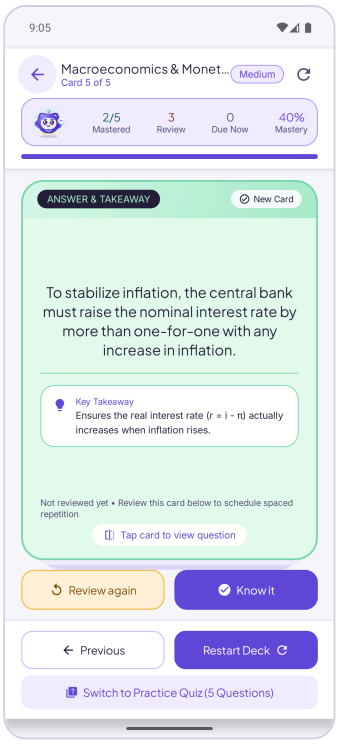

Fig. 33. Last flashcard: Next becomes Restart Deck, which only returns to card 1 and keeps progress.

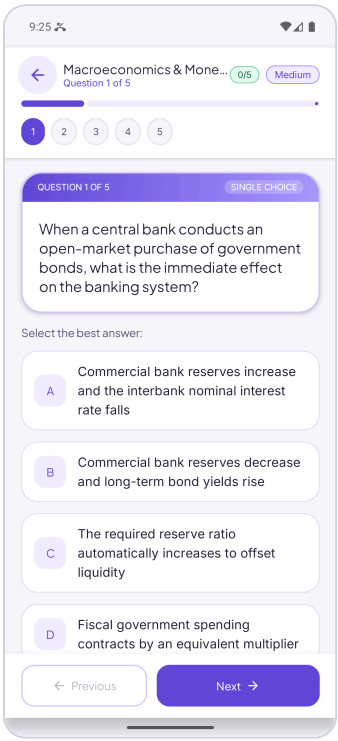

Fig. 34. Home "Resume Quiz" opens the quiz at Question 1 with nothing answered.

G. Device checks (second round)

System dark mode, maximum font size, small-phone and tablet screen sizes, and an incoming call during a quiz. Settings were changed temporarily and restored.

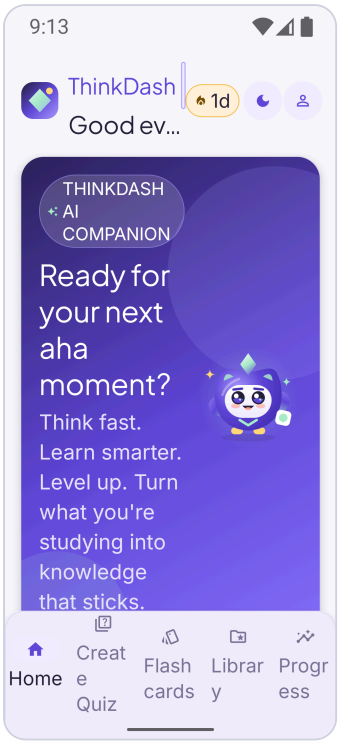

Fig. 35. Font size 2.0 (maximum): the greeting shrinks to "Good ev..." and the bottom labels split mid-word ("Creat/e Quiz", "Librar/y", "Progr/ess").

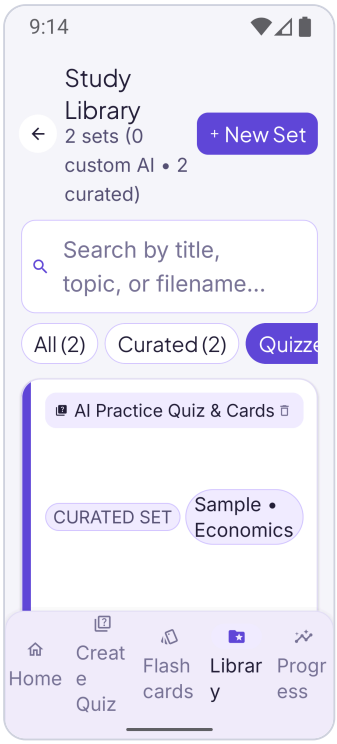

Fig. 36. Library at font size 2.0: the header wraps to five lines, the filter chips clip, and the cards get large gaps.

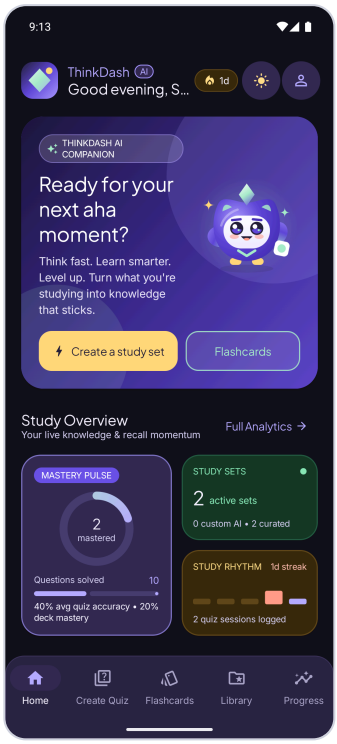

Fig. 37. Appearance set to System and the device switched to night mode: the app follows and turns dark.

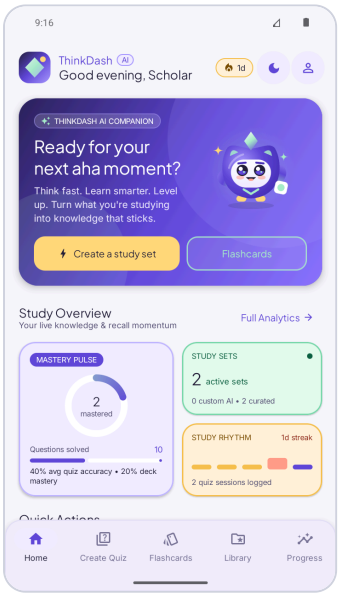

Fig. 38. Small phone (360×640 dp): the layout fits and nothing clips.

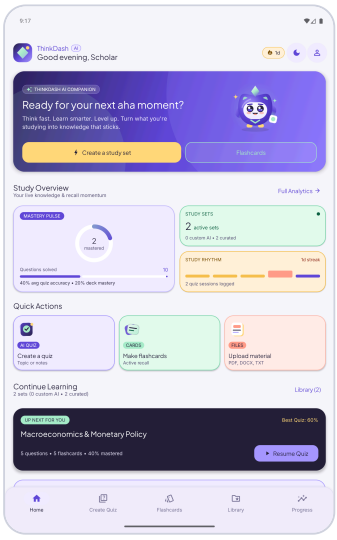

Fig. 39. Tablet (800×1280 dp): the layout adapts and shows more sections (Quick Actions, Continue Learning).

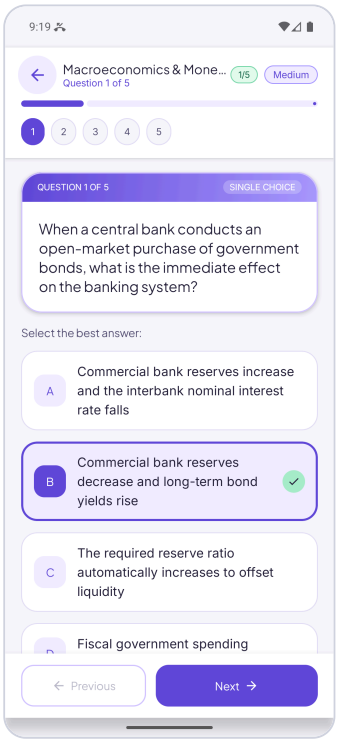

Fig. 40. After an incoming call during a quiz: the question and the selected answer are unchanged.
